„Mapping cell type reactivity across scales in progressive neuroinflammation“

„Understanding the molecular and spatially restricted drivers underlying progressive neuroinflammation is a key interest of our work. We focus on cell type-specific mechanisms to map homeostatic and reactive cell types to the inflamed microenvironment. A prime goal of our work is to decode damage and repair pathways in immune-mediated neuromuscular diseases such as multiple sclerosis and autoimmune myositis.“

Friday, 07.10.2022, 10:15 AM

Host: Hauke Werner, Department of Neurogenetics, City-Campus
